Nethone ELYMPICS

Gaming is global, online and highly competitive.

As mobile gaming has soared in terms of popularity and capital invested, the industry has witnessed an increase in fraudulent behavior and cheating.

Elympics, a ML-based system, to detect fraudulent activities.

Elympics is designed to protect mobile tournament organizers and app developers by detecting technical and behavioral misconduct. It is a platform with an intelligent matchmaking system and anti-doping protection for mobile games.

The system collects information about each player's device configuration and networking using Nethone's proprietary profiler and combines it with gameplay characteristics. The anomaly detection models then process such feature vector to return a recommendation to the game service.

European Union

Nethone Elympics is an R&D project funded by the National Centre for Research and Development from the European Smart Growth Fund.
